

ABSTRACT OF THE DISCLOSURE

A digital camera capable of simplifying detailed checking of a captured image. When a release switch instructs image capture, a CCD image-captures a subject. If an ON state detection section detects continuation of an ON state of the release switch after this image capture instruction, a display control section controls such that the captured image is displayed at an LCD monitor to the extent of the duration of the ON state of the release switch. Additionally, when a zoom button or cross-key button issues an instruction relating to the image display during the ON state, size, position or the like of a display object region of the captured image, which display object region is displayed at the LCD monitor, is changed.
